New Injection Valve Improves Performance

ACTON, MA, April 28, 1999- Liquid Metronics Incorporated just announced that all LiquiPro® pumps shipped on or after April 28th will incorporate a new and improved injection check valve body. The new valve design is molded in both PGC and PVDF and is equipped with an extension which improves chemical delivery by injecting directly into the center of the pipe, providing quicker dispersion and mixing.

The new design utilizes less housing area and is fully interchangeable with all existing LiquiPro® injection check valves. In addition to the standard 1/2" NPT connection, the quill end is equipped with a 1/4" NPT connection. By removing the flapper, the 1/4" NPT is exposed and can be connected directly into a 1/4" NPT pipe tee. The illustration below shows different methods of connecting the new valve.
